                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The sequence represents a biotinylated antisense oligonucleotide used in the purification of human telomerase. The invention relates to a purified human telomerase core enzyme protein comprising 2000-fold increased
          detect and/or quantitate polynucleotide having the human telomerase RNA component (hTR) sequence, as well as in forensic identification of criminal individuals, such as paternity teating or identification of criminal suspects or unknown descendants based on the hTR gene RFLP pattern. The PNA can be further used for treating or preventing cancer, inflammation, lymphoproliferative diseases, autoimmune disease, or neurodegenerative alseases. The PNAs in combination with other pharmaceuticals (such as antinoeplastic or cytostatic agents) can be used for treating neoplasia, hyperplasia, human immunodeficiency virus (HIV) infections, acquired immunodeficiency syndrome (AIDS) and associated pathologies, and other diseases characterised by abnormal telomera metabolism or telomerase activity. The present sequence representing HTR RNA strand #2 is used to test the inhibition of telomerase activity by the PNAs of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Purified human telomerase, useful for inducing immune response in animals, comprises several thousand folds increased purity compared with cytoplasmic crude cell preparations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Lichtsteiner SP, Vasserot AP, Pruzan RA;

component has DNA polymerase activity and a molecular weight of 200-2000 component has DNA polymerase activity and a molecular weight of 200-2000 kilo Daltons (kDa). The purified telomerase is useful for inducing a chamerase or immunogenic fragments are useful as useful for inducing a chamerase or immunogenic fragments are useful as vaccines for treating diseases associated with over-expression of telomerase, such as cancer and for producing antibodies that recognize telomerase, which are useful as a ffinity agents in isolating the proteins and for detecting the presence of proteins in a sample, such as call or tissue. Identification of telomerase aids in diagnosis of cancer or pre-cancerous states.

Telomerase and/or telomerase associated proteins are also useful for screening compounds to identify agents that alter the association of telomerase associated proteins are also useful for screening compounds to identify agents that alter the association of telomerase associated proteins or BF2H with telomerase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention relates to a purified human telomerase protein, which when associated with telomerase RNA component has DNA polymerase activity. Also disclosed in the specification is a method for assessing a regulator (preferably a telomerase inhibitor or activator of telomerase involves
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Pruzan RA;

measuring telomerase enzymatic activity of the composition in presence of a regulator. The telomerase protein of the invention may be used in developing and testing assays for measuring telomerase activity which are useful in characterising cancer and pre-cancer cells, for identifying and testing regulators of telomerase activity in in vitro assay and for preparing antibodies against telomerase. The mammalian telomerase protein of the invention is at least approximately 3000 fold more pure (in terms of telomerase activity per weight of protein) than a crude extract of cell from adenovirus- transformed kidney cell. Purified telomerase daralizers a thorough blochemical analysis of the anzyme's mechanism for developing mechanism- based regulators. The present sequence represents a human telomerase antisense oligonucleotide which has affinity to telomerase and is used to purify the telomerase protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention describes a method of obtaining mammalian telomerase protein (I). The method involves preparing enriched solution (ES) from a cell expressing telomerase where the component of (I) in ES is separated from other proteins expressed by cell by combining ES with oligonucleotide (O) having specific affinity for (I), and collecting protein bound to (O). The oligonucleotide comprises a retrievable label such as biotin and contains a sequence that is specifically recognized by telomerase protein. The oligonucleotide contains or does not contain the sequence (TTAGGG)3. The method further comprises combining a fraction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Obtaining telomerase, by preparing enriched solution from cell expressing telomerase, combining the solution with oligonucleotide having specific affinity for the protein and collecting protein bound to oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Weinrich SL, Atkinson EM, Lichtsteiner SP, Vasserot AP, Pruzan RA;

                                                                                                                                                                                  ð
                            The invention relates to a method for identifying regulators of telomerase activity that may be useful for treating cancers. The method may be used to identify regulators e.g. antibodies, of telomerase activity which may be useful as cancer treatments. It has been found that found that the cells of many human cancers have telomerase activity. This helps explain why cancer cells continue dividing without becoming senescent. If telomerase activity in cancer cells can be inhibited, the cancer cells are expected to reach senescence and cease dividing. The present sequence is human telomerase antisense oligonulceotide used to
                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         mouse, rat and chinese hamster are all claimed. Antisense deligiouscleotides can be used to block the activity of the telomerase; probes and primers can be used in detection; vectors and host cells transformed with the isolated telomerase genes can be used for production of telomerases; RNA and DNA ribozymes and triplex forming oligonucleotides directed against the telomerase genes can be used therapeutically as can plasmids. A mouse which lacks the telomerase gene (also claimed) can be used for study of telomere regulation in vivo, and the role it plays in immortalisation. Three primers (AAT11040, AAT11043,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    - useful in studying

ó,
AAT11044) were used to produce antisense oligonucleotides which were then used to produce antisense expression plasmids. AAT11040 was used alongside both AAT11043 and AAT11044 to produce two different antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is a PCR primer for a RNA component of human library obtd. From the human ling fibroblast cell line Will. 38. The RCHT can be used in the recombinant prodn. of an active telomerase mol. capable of adding sequences to chromosomal DNA telomeres, and in the resumbinant prodn. of an active telomerase mol. capable of adding sequences for the detection of mutant mammalian telomerase RNA component polynuclectides. The RCHT may also be used in the identification of telomerase modulating agents, and in the detection of telomerase related, or neoplastic conditions in a patient. Polynuclectides of at least 25 consecutive nucleotides identical, or complementary to the RFHT sequence linked to heterologous transcriptional regulatory sequences, can be used for the gene therapy of human diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         esp. human - useful in identifying

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents an antisense oligonucleotide directed against the human telomerase RNA component gene sequences. The oligonucleotide can be used as an affinity agent in the methods of the invention, which are used to purify human telomerase. The methods of the use of several sequential steps, including the use of two matrixes that bind molecules bearing negative charges, a matrix that binds molecules bearing negative charges, an matrix that binds molecules bearing negative charges, an affinity purification step and a size separation. Telomerase is a particular target of anticancer therapies, and is useful in assays for characterizing (pre)cancerous cells. Telomerase can also be used to screen for specific modulators, for biochemical analysis of its activity, and in preparation of antibodies. Fragments of telomerase, or nucleic acid encoding them, are used in vaccines, and for treating over expression of telomerase, particularly in

                                                      The present sequence represents an antisense oligonucleotide directed against the human telomerase RNA component gene sequences. The oligonucleotide can be used as an affinity agent in the methods of the invention, which are used to purify human telomerase. The methods of the the use of several sequential steps, including the use of two matrixes that bind molecules bearing negative charges, a matrix that binds molecules bearing negative charges, a matrix that binds size separation. Telomerase is a particular target of anticancer therapies, and is useful in assays for characterizing (pre) cancerous cells. Telomerase can also be used to screen for specific modulators, for biochemical analysis of its activity, and in preparation of antibodies. Fragments of telomerase, or nucleic acid encoding them, are used in vaccines, and for treating over expression of telomerase, particularly in

```
Sequences shown in AAV41169 to AAV41181 represent antisense
oligonucleotides to the RNA component of human telomerase (hTR). These
antisense oligonucleotides specifically hybridise to a nucleotide
sequence within an accessible region of the HTR, but that does not
bybridise to a sequence within the template region of hTR. These
component of human telomerase in a sample. This is useful for diagnosing
component of human telomerase in a sample. This is useful for diagnosing
cancer (especially neuroblastoma, bladder, colon and prostate cancer),
component of human telomerase in a sample. The inhibitory
cancer (especially neuroblastoma, bladder, colon and prostate cancer),
coligonucleotides can inhibit the telomerase activity level in a cell by
coligonucleotides can inhibit the telomerase activity level in a cell by
coligonucleotides and inhibit the telomerase activity inhibiting the half-
life of the telomerase RNA component transcript, inhibiting the half-
coligonoment into the telomerase holoenzyme, or inhibiting the
polymerase activity of telomerase activity in both cultured cells and in
preventing cancer, for contraception or sterilisation, for
calls in vivo. They can be used in therapeutics for treating or
preventing cancer, for contraception or sterilisation, for
immunosuppression, and for selectively down-regulating specific branches
colimnatory therapies or for treating infections by, e.g. yeast,
New polynucleotide(s) anti:sense to human telomerase - used for detecting or inhibiting human telomerase, e.g. for treating cancers, contraception, immuno-suppression or treating infection.

Sequences shown in AAV41169 to AAV41181 represent antisense
cligonuclectides to the RNA component of human telomerase (hTR). These
antisense oligonuclectides specifically hybridise to a nuclectide
capture within an accessible region of the hTR, but that does not
component of human telomerase in a sample. This is useful for diagnosing
cancer (especially neuroblastoma, bladder, colon and prostate cancer),
component of human telomerase in a sample. This is useful for diagnosing
cancer (especially neuroblastoma, bladder, colon and prostate cancer),
cancer (especially neuroblastoma, che minibitory
cancer (especially neuroblastoma, concerning the half-
call controlled component transcript, inhibiting assembly of
the RNA component into the telomerase holoenzyme, or inhibiting telomerase activity in both cultured cells and in
calls in vivo. They can be used in therapeutics for treating or
cancer inhibiting telomerase activity in both cultured cells and in
calls in vivo. They can be used in therapeutics for treating or
cancer inflammatory therapeuts or for treating infections by, e.g. yeast,
cancer inflammatory theraples or for treating infections by, e.g. yeast,
cancer inference or paragraphs or for treating infections by, e.g. yeast,

This invention describes a novel composition comprising human telomerase having at least 2000-fold (preferably at least 6000-fold) increased relative purity compared with crude extract of cells from adenovirus-transformed kidney cell line. The composition is useful for eliciting an immune response in animals and may therefore be used as a vaccine for reacting diseases associated with the overexpression of telomerase e.g. cancer. AAZ23626-Z23637 represent oligonucleotides used in the isolation of human clone 28-1 which contains a fragment of the human telomerase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             human; immune response; cancer; vaccine; treatment; disease;
                                                                                                                                                                                                                                                                                                                   useful for treating diseases

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention describes a novel composition comprising human telomerase relative purity compared with created relative purity compared with created extract of cells from adenovizustransformed kidney cell line. The composition is useful for eliciting an immune response in animals and may therefore be used as a vaccine for treating diseases associated with the overexpression of telomerase e.g. cancer. AAZ23626.223637 represent oligomucleotides used in the isolation of human clone 28-1 which contains a fragment of the human telomerase

The invention relates to polynucleotide inhibitors (I) and methods for inhibiting telomerase activity. (I) are useful in inhibiting telomerase activity and proliferation of a telomerase positive cell, and in manufacturing a medicament for inhibiting telomerase activity in a cell and in treating a medicament for inhibiting telomerase activity in a cell cadenocarcinoma of breast, prostate or colon, mixed cell leukaemis. Consection of the construction of telomerase activity in a cell and in treating a tumour or in manufacturing a medicament for the cuseful in treating a tumour or in manufacturing a medicament for the consection of tumour. The polynucleotide inhibitors may also be used in diagnostic assays for detecting RNA or DNA. Inhibition of telomerase activity in cells in vivo is useful in prophylactic and therapeutic activity in cells in vivo is useful in prophylactic and therapeutic context in a concer and other disorders involving inappropriate expression of telomerase, and in treating veterinary proliferative chases. Inhibition of telomerase in haematopoietic stem cells is useful context in the cells in the context of the c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               branches of the immune system. The present sequence represents human telomerase polynucleotide inhibitor \#9, as described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Purified human telomerase, useful for inducing immune response in animals, comprises several thousand folds increased purity compared with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, Telomerase, vaccine, antibody, cancer; BF2H, nucleolin; antisense oligonucleotide; Oligo 14; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New polynucleotide useful for inhibiting telomerase activity in cells, or for treating telomerase-mediated condition or disease, such as cancers,
                                                                                                                                                                                                                                                                                                                                                   This invention describes a novel composition comprising human telomerase having at least 2000-fold (preferably at least 6000-fold) increased relative purity compared with crude extract of cells from adenovirus-transformed kidney cell line. The composition is useful for eliciting an immune response in animals and may therefore be used as a vaccine for treating diseases associated with the overexpression of telomerase e.g. cancer. AAZ23626-Z23637 represent oligonucleotides used in the isolation of human clone 28-1 which contains a fragment of the human telomerase described in the method of the invention
                                                                                                                                                                                                        Compositions comprising human telomerase, useful for treating diseases associated with overexpression of telomerase e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; telomerase; hTR; cytostatic; anti-inflammatory; adenocarcinoma;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ò
                                                                           The sequence represents a biotinylated antisense oligonucleotide used in the purification of human telomerase. The invention relates to a purified human telomerase core enzyme protein comprising 2000-fold increased burity compared with a crude extract of calls from adenovirus-transformed purity compared with a crude extract of calls from adenovirus-transformed component has DNA polymerase activity and a molecular weight of 200-2000 kilo baltons (kDa). The purified telomerase is useful for inducing a humoral or cell-mediated immune response in an animal. Purified telomerase or immunogenic fragments are useful as vaccines for treating diseases associated with over-expression of telomerase, which are useful as a fifnity agents in isolating the proteins and for detecting the proteins of proteins in a sample, such as cell or tissue. Identification of telomerase aids in disgnosis of cancer or pre-cancerous states.

Telomerase and/or telomerase associated proteins are also useful for screening compounds to identify agents that alter the association of telomerase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Purified human telomerase, useful for inducing immune response in animals, comprises several thousand folds increased purity compared with cytoplasmic crude cell preparations.

                                                   The sequence represents a biotinylated antisense oligonucleotide used in the purification of human telomerase. The invention relates to a purified human telomerase core enzyme protein comprising 2000-fold increased purity compared with a crude extract of cells from adenovirus-transformed widney cell line (293 cells) and when associated with telomerase RNA component has DNA polymerase activity and a molecular weight of 200-2000 kilo Daltons (kDa). The purified telomerase is useful for inducing a humoral or cell-mediated immune response in an animal. Purified a telomerase or immunogenic fragments are useful as vaccines for treating diseases associated with over-expression of telomerase, such as cancer and for producing antibodies that recognize telomerase, which are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                               as affinity agents in isolating the proteins and for detecting the presence of proteins in a sample, such as cell or tissue. Identification of telomerase aids in diagnosis of cancer or pre-cancerous states. Telomerase and/or telomerase associated proteins are also useful for screening compounds to identify agents that alter the association of telomerase-associated proteins, such as nucleolin or EF2H with telomerase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Amplifying signal by contacting nanoparticles (N) having bound oligonuclectides to silver deposited on substrate to form N-silver sandwich that is contacted with silver, reducing agent to form silver-N-silver sandwich.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Silver staining, signal detection; nanoparticle; diagnosis; screening;

The present sequence is that of an oligonuclectide prepared using phosphoramidite chemistry. A nanoparticle conjugate was prepared by CC joining the 5'-meraploalkyl oligonuclectide to gold nanoparticles. The nanoparticle conjugate was used to enhance the sandwich amplification of a silver signal on glass slides containing silver sports from coligonucleotide assays performed using silver staining. This illustrated the method of the invention, which is based on the discoveries that: (1) gold nanoparticles coated with oligonucleotides bind to silver that has previously been deposited on gold nanoparticle-oligonucleotide conjugates commobilised by hybridisation on a glass substrate or plate; and (2) that the gold-nanoparticle-oligonucleotide-silver-gold oligonucleotide conjugates consorting silver deposition in detecting systems where the formation of silver spot serves as a reporter for the presence of amolecule, or including proteins, nucleic acids and small molecules. The detecting systems include detection of molecules in situ (e.g. on cells or in a tissue sample) and assays where the target molecules. The method has special cullity in increasing the signal strength in diagnostic and screening applications involving detection of target molecules arrayed at discrete companion in signal proteins in solid surface. It provides a means for greatly enhancing the sample, economical, and provides a large enhancement in signal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Pruzan RA;

This invention relates to a purified human telomerase protein, which when associated with telomerase RNA component has DNA polymerase activity.

Also disclosed in the specification is a method for assessing a regulator (preferably a telomerase inhibitor or activator of telomerase involves casuring telomerase enzymatic activity of the composition in presence of a regulator. The telomerase protein of the invention may be used in the activation of the invention may be used in the activity assays for measuring telomerase activity which are useful in characterising cancer and pre-cancer cells, for identifying and testing regulators of telomerase activity in in vitro assay and for preparing antibodies against telomerase. The mammalian telomerase protein of the invention is at least approximately 3000 fold more pure (in terms of telomerase activity per weight of protein) than a crude extract of telomerase activity per weight of protein) than a crude extract of cell from adenovirus- transformed kidney cell. Purified telomerase for facilitates a thorough biochemical analysis of the enzyme's mechanism for develophing mechanism- based regulators. The present sequence represents a human telomerase antisense oligonucleotide which has affinity to telomerase and is used to purify the telomerase protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Pruzan RA;

Also disclosed with telomerase RNA component has DNA polymerase activity.

Also disclosed in the specification is a method for assessing a regulator (preferably a telomerase RNA component has DNA polymerase activity.

Also disclosed in the specification is a method for assessing a regulator of preferably a telomerase inhibitor or activator of telomerase involves measuring telomerase involves measuring telomerase sorivity of the composition in presence of a regulator. The telomerase protein of the invention may be used in testing regulators of telomerase protein of the invention and carterising cancer and pre-cancer cells, for identifying and testing regulators of telomerase activity in in vitro assay and for preparing antibodies against telomerase. The mammalian telomerase protein of the invention is at least approximately 3000 fold more pure (in terms of telomerase activity per weight of protein) than a crude extract of cell from adenovirus- transformed kidney cell. Purified telomerase for facilitates a thorough biochemical analysis of the enzyme's mechanism for developing mechanism- based regulators. The present sequence represents a human telomerase antisense oligonucleotide which has affinity to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Obtaining telomerase, by preparing enriched solution from cell expressing telomerase, combining the solution with oligonucleotide having specific affinity for the protein and collecting protein bound to oligonucleotide.
invention relates to a purified human telomerase protein, which when
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention describes a method of obtaining mammalian telomerase protein (I). The method involves preparing enriched solution (ES) from a cell expressing telomerase where the component of (I) in ES is separated from other proteins expressed by cell by combining ES with oligonucleotide (O) having specific affinity for (I), and collecting
                                                                                                                                                                                                                                                                                                                                    telomerase and is used to purify the telomerase protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   mammalian telomerase protein; telomerase purification; telomere; anion exchange matrix; selectivity matrix; gel filtration chromatography; gradient centrifugation; antisense oligonuclecide; se.

                                                                       containing telomerase protein with an anion exchange matrix, and collecting protein that binds the matrix, combining a fraction containing telomerase protein with a mation exchange matrix, and collecting protein that binds the matrix. Guch as a hegarin matrix), and collecting protein that binds the matrix. The method comprises successively enriching fractions containing telomerase protein on exchange matrices and combining a fraction containing telomerase protein with an intermediate selectivity matrix, collecting protein that binds the matrix, where the intermediate selectivity matrix and separating a fraction containing the telomerase protein by gel filtration chromatography or gradient centrifugation. The telomerase is enriched from an extract of cells stably expressing telomerase. This sequence represents an antisense oligonucleotide to the RNA component of human telomerase that can be used in the purification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Obtaining telomerase, by preparing enriched solution from cell expressing telomerase, combining the solution with oligonucleotide having specific affinity for the protein and collecting protein bound to oligonucleotide.
protein bound to (0). The oligonucleotide comprises a retrievable label such as biotin and contains a sequence that is specifically recognized by telomerase protein. The oligonucleotide contains or does not contain the sequence (TTAGGG)3. The method further comprises combining a fraction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention describes a method of obtaining mammalian telomerase protein (I). The method involves preparing enriched solution (ES) from a cell expressing telomerase where the component of (I) in ES is separated from other proteins expressed by cell by combining ES with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Pruzan RA;

          protein bound to (0). The oligonaclectide comprises a retrievable label such as biotin and contains a sequence that is specifically recognized by telemerase protein. The oligonaclectide contains or does not contain the sequence (TTMGGG)3. The method further comprises combining a fraction containing telomerase protein with an anion exchange matrix, and collecting protein that binds the matrix, combining a fraction containing approach with a cation exchange matrix. The method comprises successively enriching fractions containing telomerase protein that binds the matrix. The method of matrix), and collecting protein that binds the matrix. The method comprises successively enriching fractions containing telomerase protein that binds the matrix. The method on several different ion exchange matrices and combining a fraction containing telomerase protein with an intermediate selectivity matrix, collecting protein that binds the matrix, where the intermediate selectivity matrix, and separating a fraction containing the telomerase protein where the intermediate is selectively matrix and separating a fraction containing the telomerase protein by gel filtration chromatography or gradient centrifugation. The collecting protein the matrix of selectivity matrix and separating a fraction containing the telomerase is a function of the seal of t

Identifying telomerase regulators useful for treating cancer.

```
telomerase activity that may be useful for treating cancers. The method activity which may be useful for treating cancers. The method activity which may be useful as cancer treatments. It has been found that found that the cells of many human cancers have telomerase activity. This helps explain why cancer cells continue dividing without becoming senescent. If telomerase activity in cancer cells can be inhibited, the cancer cells are expected to reach senescence and cease dividing. The present sequence is human telomerase antisense oligonulceotide used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                     ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents an antisense oligonucleotide directed against the human telomerase RNA component gene sequences. The oligonucleotide can be used as an affinity agent in the methods of the invention, which are used to purify human telomerase. The methods of the the use of several sequential steps, including the use of two matrixes that bind molecules bearing negative charges, a matrix that binds molecules bearing negative charges, a matrix that binds molecules bearing negative charges, an affinity purification step and a size separation. Telomerase is a particular target of anticancer therapies, and is useful in assays for characterizing (pre) cancerous cells. Telomerase can also be used to screen for specific modulators, for biochemical analysis of its activity, and in preparation of antibodies. Fragments of telomerase, or nucleic acid encoding them, are used in vaccines, and for treating over expression of telomerase, particularly in
activity which may be useful as cancer treatments. It has been found that found that the cells of many human cancers have telomerase activity. This helps explain why cancer cells continue dividing without becoming senescent. If telomerase activity in cancer cells can be inhibited, the cancer cells are expected to reach senescence and cease dividing. The present sequence is human telomerase antisense oligonulceotide used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; telomerase RNA component; anticancer therapy; purification; assay; vaccine; cancer; antisense oligonucleotide; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes a novel composition comprising human telomerase having at least 2000-fold (preferably at least 6000-fold) increased relative purity compared with crude extract of cells from adenovirus-transformed kidney cell line. The composition is useful for eliciting an immune response in animals and may therefore be used as a vaccine for reacting diseases associated with the overexpression of telomerase e.g. cancer. AAZ23656-Z23637 represent oligomothedises used in the isolation of human clone 28-1 which contains a fragment of the human telomerase
                                                                                                                                                                                                                                                                                                                   human; immune response; cancer; vaccine; treatment; disease;

```
The sequence represents a biotinylated antisense oligonucleotide used in the purification of human telomerase. The invention relates to a purified human telomerase core enzyme protein comprising 2000-fold increased purity compared with a crude extract of cells from adenovirus-transformed kidney cell line (293 cells) and when associated with telomerase RNA component has DNA polymerase activity and a molecular weight of 200-2000 kilo Daltons (kDa). The purified telomerase is useful for inducing a humoral or cell-mediated immune response in an animal. Purified telomerase or immunogenic fragments are useful as vaccines for treating diseases associated with over-expression of telomerase, such as cancer and for producing antibodies that recognize telomerase, which are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   as affinity agents in isolating the proteins and for detecting the presence of proteins in a sample, such as cell or tissue. Identification of telomerase aids in diagnosis of cancer or pre-cancerous states. Telomerase and/or telomerase associated proteins are also useful for screening compounds to identify agents that alter the association of telomerase-associated proteins, such as nucleolin or EF2H with telomerase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Purified human telomerase, useful for inducing immune response in animals, comprises several thousand folds increased purity compared with cytoplasmic crude cell preparations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Atkinson EM, Lichtsteiner SP, Vasserot AP, Pruzan RA;
                                                                                                                                                                                                                                                                                                                                                  Human, Telomerase, vaccine, antibody, cancer, BF2H, nucleolin, antisense oligonucleotide, Oligo 5, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        6.3%; Score 28.4; DB 1; Length 30; 96.7%; Pred. associated with telomerase RNA component has DNA polymerase activity.

Also disclosed in the specification is a method for assessing a regulator (prefeated) at elomerase inhibitor or activator of telomerase involves measuring telomerase enzymatic activity of the composition in presence of a regulator. The telomerase protein of the invention may be used in developing and testing assays for measuring telomerase activity which are useful in characterising cancer and pre-cancer cells, for identifying and testing regulators of telomerase activity in in vitro assay and for preparing antibodies against telomerase. The mammalian telomerase protein of telomerase activity per weight of protein) than a crude extract of cell from adenovirus- transformed kidney cell. Purified telomerase (a facilitates a thorough biochemical analysis of the enzyme's mechanism for developing mechanism- based regulators. The present sequence represents a thomorase autisense oligonuclocide which has affinity to thomorase and is used to purify the telomerase protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention relates to a purified human telomerase protein, which when

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention describes a method of obtaining mammalian telomerase protein (1). The method involves preparing enriched solution (ES) from a cell expressing telomerase where the component of (1) in ES is separated from other proteins expressed by cell by combining ES with oligonucleotide (0) having specific affinity for (1), and collecting protein bound to (0). The Oligonucleotide comprises a retrievable label such as biotin and contains a sequence that is specifically recognized by telomerase protein. The Oligonucleotide contains or does not contain the sequence (TTAGGG)3. The method further comprises combining a fraction containing telomerase protein with a cation exchange matrix, and collecting protein with a cation exchange matrix. The method collecting protein with a cation exchange matrix. The method containing a fraction containing telomerase protein with a cation exchange matrix. The method comprises successively enriching fractions containing telomerase protein with that binds the matrix. The method containing telomerase protein with an intermediate selectivity matrix, collecting protein that binds the matrix, where the intermediate selectivity matrix, collecting protein that binds the matrix, where the intermediate protein and separating a fraction containing the centrification. The elomerase in enriched from an extract of cells stably expressing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Obtaining telomerase, by preparing enriched solution from cell expressing telomerase, combining the solution with oligonucleotide having specific affinity for the protein and collecting protein bound to oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         telomerase. This sequence represents an antisense oligonucleotide to the RNA component of human telomerase that can be used in the purification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Weinrich SL, Atkinson EM, Lichtsteiner SP, Vasserot AP, Pruzan RA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                           The invention relates to a method for identifying regulators of telomerase activity that may be useful for treating cancers. The method may be useful for treating cancers. The method may be useful as cancer treatments of telomerase activity which may be useful as cancer treatments. It has been found that found that the cells of many human cancers have telomerase activity. This sensescent. If telomerase activity in cancer cells can be inhibited, the cancer cells are expected to reach sensescence and cease dividing. The present sequence is human telomerase antisense oligonulceotide used to

This primer is used for the RT-PCR amplification of an RNA component of human telomerase (hTR). This is used in the method of invention of determining the amount of hTR in a sample. The method comprises camplifying a sequence of hTR and a control polynucleotide from a sample and determining an amount of amplified hTR and an amount of amplified control polynucleotide. The amount of amplified hTR is normalised with crespect to the amount of Amplified control polynucleotide to provide a normalised amount of hTR which provides antisense oligonucleotides to the hTR which may specifically be used for detection of an RNA component of human telomerase in a sample. This is useful for diagnosing cancer (especially neuroblastoma, bladder, colon and prostate cancer), and providing prognosis for a cancer patient. The antisense oligonucleotides con bused for inhibiting telomerase activity in both cultured cells and in cells in vivo. They can be used in therapeutics for treating or contraception or sterilisation, for immunosuppression, and for selectively down-regulating specific branches confinammatory theraples or for treating infections by, e.g. yeast,
                                                                                                                                    New polynucleotide(s) anti:sense to human telomerase - used for detecting or inhibiting human telomerase, e.g. for treating cancers, contraception, immuno-suppression or treating infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New human GC6 gene, useful for identifying agents for treating diseases and/or conditions associated with cell senescence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cellular senescence; modulator; GC6 gene; senescent gene expression;

                                                                                                                                                                                                                                                                                                                                                                    ő
                                                               senescence. Recombinant expression vectors comprising a recombinant polynucleotide corresponding to a polynucleotide in a human GCG gene, are useful for altering senescent gene expression. The vectors and host cells comprising the protein gene expression. The polynucleotides are useful for producing the protein, pGCG and nucleic acid derivatives. The proteins encoded are useful for rational antibodies specific for pGCG, which are useful for isolating pGCG, and for detecting cells comprising pGCG in complex cell mixtures. The characterization of the polynucleotides enable the identification of therapeutic agents that identify and distinguish between young and senescent cells. This enables treatment of aging diseases induced or exacerbated by cellular senescence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a method for diagnosing and/or monitoring the evolution of cancers. The method comprises analysing enzyme telomerase RNA in blood plasma or serum. The method is typically used for diagnosing breast, ovarian, stomach or colon cancer and/or monitoring the evolution of the cancers after treatment by chemotherapy or operations. The present sequence is a PCR primer for human telomerase RNA (hTR), which was used in the example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    e.g. breast

The invention relates to promoter regions from mouse and human telomerase

RNA (TR) component genes. The TR gene promoter can be linked to a

RNA (TR) component genes. The TR gene encoding a cytocoxin, for therapy of

cancer, especially neoplasia. The telomerase is necessary for the

cancer, especially neoplasia. The telomerase is necessary for the

currestricted proliferative capacity of many human cancers. Mutation or

dysregulation of the telomerase expression pathway may cause reactivation

or upregulation of telomerase expression in cancer. Substances,

cleantified in the methods, can be used to block transcription from the TR

gene promoter through interaction of the 5' regulatory sequences. These

cuspicide nucleic acids and factors that disrupt signal transduction, are

cuseful for cancer therapy. In particular, gene therapy vectors

cuseful for cancer therapy. In particular, gene therapy vectors

cuseful for cancer therapy. In particular, gene therapy vectors

cuseful for cancer therapy. In particular, gene therapy vectors

cuseful for cancer therapy in particular, gene therapy vectors

cuseful for cancer therapy in particular, gene therapy vectors

cuseful for cancer therapy and the promoter and a viral thymidine

cuseful for an be controlled or treated. Direct down-regulation of

ceffective anticancer therapy and the cloning of the hTR gene promoter

allows the analysis of therapeutic molecules which modulate hTR promoter

callows the analysis of therapeutic molecules which modulate hTR promoter

callows the analysis of therapeutic molecules which modulate for amplifying

The RNA components of (non) human mammalian telomerase(s) especially from mouse, rat and chinese hamster are all claimed. Antisense oligonucleotides can be used to block the activity of the telomerase; probes and primers can be used in detection; vectors and host cells transformed with the isolated telomerase genes can be used for production of telomerases; RNA and DNA ribozymes and triplex forming oligonucleotides directed against the telomerase agnes can be used therapeutically as can plasmids. A mouse which lacks the telomerase gene (also claimed) can be used for study of telomere regulation in vivo, and hard role it plays in immortalisation. Three primers (AAT11040, AAT11043, AAT11044) were used to produce antisense oligonucleotides which were then used to produce antisense oligonucleotides which were then alongside both AAT11043 and AAT11044 to produce two different antisense
                                                                   Primer for production of telomerase antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      senescence and immortalisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Example 8; Page 53; 85pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence, a forward primer for the RNA component of human telomerase (RCHT), was used in a primed in situ labelling (PRINS) procedure. The RCHT can be used in the recombinant prodn. of an active telomerase mol., capable of adding sequences to chromosomal DNA telomeras, and in the synthesis of mutant sequences for the detection of mutant mammalian telomerase RNA component polymoleotides. The RCHT may also be used in the identification of telomerase modulating agents, and in the detection of telomerase related, or neoplastic conditions in a patient. Polymoleotides of at least 25 consecutive mucleotides identical, or complementary to the RCHT sequence linked to heterologous transcriptional regulatory sequences, can be used for the gene therapy of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence, a nested PCR primer for the RNA component of human telomerase (RCHT), was used in a 5' RACE procedure. The RCHT can be used in the recombinant prodn. of an active telomerase mol., capable of adding sequences to chromosomal DNA telomeras, and in the synthesis of mutant sequences for the detection of mutant mammalian telomerase RNA component polynucleotides. The RCHT may also be used in the identification of telomerase modulating agents, and in the detection of telomerase related, or neoplastic conditions a patient. Polynucleotides of at least 25 consecutive nucleotides identical, or complementary to the RCHT sequence linked to heterologous transcriptional regulatory sequences, can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           RNA component of mammalian telomerase, esp. human - useful in identifying

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is a PCR primer for a RNA component of human telomerase (RCHT), antisense plasmid. RCHT was derived from a genomic DNA library obtd. from the human lung fibroblast cell line WI-38. The RCHT can be used in the recombinant prodm. of an active telomerase mol., capable of adding sequences to chromosomal DNA telomeres, and in the synthesis of mutant sequences for the detection of mutant mammalian telomerase RNA component polynucleotides. The RCHT may also be used in the identification of telomerase modulating agents, and in the detection of telomerase related, or neoplastic conditions in a patient. Polynucleotides of at least 25 consecutive nucleotides identical, or complementary to the RCHT sequence linked to heterologous transcriptional regulatory sequences, can be used for the gene therapy of human diseases
                                                                                                                                                                                                                                                                                                                                                                   RNA component of mammalian telomerase, esp. human - useful in identifying e.g. candidate telomerase-modulating agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             RNA component; human; telomerase; polymerase chain reaction; recombinant production; synthesis; mutant; detection; madulating agent; neoplastic condition; modulating agent; neoplastic condition; transcriptional regulatory sequence; gene therapy; disease; PCR primer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gapв
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          5.8%; Score 26; DB 1; Length 26;

                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                     The present sequence, a PCR primer for the RNA component of human telomerase (RCHT), was used in a 3' RACE procedure. The RCHT can be used in the recombinant prodn. of an active telomerase mol., capable of adding sequences to chromosomal DNA telomeres, and in the synthesis of mutant sequences for the detection of mutant mammalian telomerase RNA component polynucleotides. The RCHT may also be used in the identification of telomerase modulating agents, and in the detection of telomerase related, or neoplastic conditions in a patient. Polynucleotides of at least 25 consecutive nucleotides identical, or complementary to the RCHT sequence linked to heterologous transcriptional regulatory sequences, can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DNA encoding essential RNA components of human telomerase - also truncated or recombinant telomerase, useful for diagnosis and treatment of cancer and infection by eukaryotic parasites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents PCR 3'-primer R3C used for amplifying human telomerase (hTR). The RNA and DNA can be used in hybridisation assays to detect or quantify telomerase activity in cells, tissue or fluid samples, e.g. for diagnosis of eukaryotic parasites (yeast and protozoa) or tumours. It is also useful as primers for amplification assays. The truncated or recombinant vertebrate telomerase is used
                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                     ;

```
screening assay) while the RNA or other inhibitors such as antisense molecules, are used to reduce such activity. Typical applications are initiation/restoration of activity to cause senescence or to prevent immortalisation of calls in tunours or parasites. The DNA is also used to produce recombinant telomerase, which can then be used conventionally to raise antibodies for diagnostic detection of telomerase. Detecting telomerase allows early diagnosis of tumour or infection, before clinical signs manifest. Telomerase inhibitors directed against e.g. Trypanosoma should cause fewer side effects than drugs currently used to treat such infections. The DNA encodes those parts of hTR RNA essential for activity but are significantly shorter than the endogenous RNA component
                                                                                                                                                                                                                                                                                                                                                                                                   ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New polynucleotide(s) anti:sense to human telomerase - used for detecting or inhibiting human telomerase, e.g. for treating cancers, contraception, immuno-suppression or treating infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RNA component; human telomerase; antisense oligonucleotide; infection; neuroblastoma; bladder cancer; colon cancer; prostate cancer; cancer; contraception; sterilisation; immunosuppression; therapeutic; hTR; immune system down-regulation; anti-inflammatory therapy; RT-PCR; primer;
therapeutically to increase telomerase activity (also as reagents in the

This is used in the method of invention of determining the amount of hTR in a sample. The method comprises amplifying a sequence of hTR and a control polynucleotide from a sample and determining an amount of amplified hTR and an amount of amplified are control polynucleotide. The amount of amplified of the sequence of hTR is normalised with respect to the amount of amplified control polynucleotide to provide anormalised amount of hTR which provides a determination of the amount of hTR in the sample. The invention provides antisense oligonucleotides to
                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           RNA component of human telomerase (hTR) amplifying forward primer.

ö
the hTR which may specifically be used for detection of an RNA component of human telomerase in a sample. This is useful for diagnosing cancer (especially neuroblastoma, bladder, colon and prostate cancer), and providing prognosis for a cancer patient. The antisense oligonucleotides can be used for inhibiting telomerase activity in both cultured cells and in cells in vivo. They can be used in therapeutics for treating or preventing cancer, for contraception or sterilisation, for immunosuppression, and for selectively down-regulating specific branches of the immune system, e.g. a specific subset of T-cells, in anti-inflammatory therapies or for treating infections by, e.g. yeast,

ö
compound; (B) preparation of recombinant telomerase by contacting a protein preparation of HTRT with a telomerase RNA component; (C) detection of the HTRT RNA or protein in a sample by binding a relevant probe to the sample and detecting the complex formed or in the case of RNA detection, amplifying the product and correlating the presence of complex or amplification product with presence of HTRT in the sample; and (D) increasing the proliferation of a vertebrate cell by increasing hTRT expression; and (E) the use of an agent that causes an increase in cell vertebrate cell proliferation to create a medicament that inhibits ageing. A protein preparation of hTRT and the polynucleotide encoding hTRT can be used in the manufacture of medicaments for inhibiting the effect of ageing or cancer. Inhibitors of telomerase activity can be used to treat conditions that are associated with high telomerase activity. A protein preparation of hTRT can also be used in the new methods
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, telomerase reverse transcriptase, hTRT, TRT, diagnosis, prognosis, cell proliferation, cancer, ageing, ribonucleoprotein, PCR primer, ss.

present invention also describes the following methods: (A) determining whether a test compound is a modulator of hTRT, by detecting the change in hTRT recombinant protein or polymucleotide, on administration of the compound; (B) preparation of recombinant telomerase by contacting a protein preparation of hTRT with a telomerase RNA component; (C) detection of the hTRT RNA or protein in a sample by binding a relevant probe to the sample and detecting the complex formed or in the case of RNA detection, amplifying the product and correlating the presence of complex or amplification product with presence of hTRT in the sample; and (D) increasing the proliferation of a vertebrate cell by increasing hTRT expression; and (E) the use of an agent that causes an increase in cell vertebrate cell proliferation of reate a medicament that inhibits of ageing A protein preparation of hTRT and the polymucleotide encoding hTRT can be used in the manufacture of medicaments for inhibiting the effect of ageing or cancer. Inhibitors of telomerase activity can be used
                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Primers F3b and R3c (see AAV19489) were designed for the PCR amplification of the human telomerase hTR gene (see AAV19481). hTR mRNA levels were showed to correlate with telomerase activity levels in a variety or mortal and immortal cell lines. Methods of the invention allow detection and quantitation of TPC2 (see AAV19479), TPC3 (see AAV19480) and/or TPC2 gene products and can be used to detect immortal cells, especially telomerase positive cancer cells
                                                                                                                                                                                                                                                                                    treat conditions that are associated with high telomerase activity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    amplification of the human telomerase hTR gene (see AAV19481). hTR mRNA levels were showed to correlate with telomerase activity levels in a variety or mortal and immortal cell lines. Methods of the invention allow detection and quantitation of TPC2 (see AAV19479), TPC3 (see AAV19480) and/or TPC2 gene products and can be used to detect immortal cells, especially telomerase positive cancer cells

cellular portion of body fluid from a cancer patient using a modified cellular portion of body fluid from a cancer patient using a modified tellular portion of body fluid from a cancer patient using a modified cellular portion of a modified cancer comprises: (a) removing the cellular portion of a body fluid specimen from the patient; (b) preparing a protein extract from the body fluid remainder; (c) assaying the extract for the presence and quantity of telomerase RNA or telomerase activity; and (d) comparing the results with normal levels, to determine the presence of cancer. The methods are therapy effectiveness Unlike prior art telomerase activity assays in cancer patients, the method allows noninvasive sample collection. The methods are also more reliable and less tumour specific than other methods which detect circulating tumour markers. The present sequence represents a human telomerase RNA template PCR primer used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes a novel method for disgnosing bladder cancer which comprises detecting telomerase RNA in a urine sample. The method of the invention has greater sensitivity and reliability than assays for telomerase activity (cf. WO 9735871). This sequence represents a primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Detecting telomerase RNA in urine - useful for diagnosis of bladder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Telomerase; human; diagnosis; bladder cancer; detection; urine;

                                                                                                                                                                                                                                                                                                                                                                  This invention describes a novel method for diagnosing bladder cancer which comprises detecting telomerase RNA in a urine sample. The method of the invention has greater sensitivity and reliability than assays for telomerase activity (cf. WO 975871). This sequence represents a primer used in the method of the invention

                                                                                                                                                       The invention relates to methods for modulating and identifying cellular senescence. Recombinant expression vectors comprising a recombinant polymucleotide corresponding to a polymucleotide in a human GGG gene, are useful for altering senescent gene expression. The vectors and host cells comprising the protein, pGGG and mucleic acid derivatives. The prevent or modulate senescent gene expression. The polymucleotides are useful for pordering the protein, pGGG and mucleic acid derivatives. The proteins encoded are useful for raising antibodies specific for pGGG, which are useful for isolating pGGG, and for detecting cells comprising pGGG in complex cell mixtures. The characterization of the polymucleotides enable the identification of therapeutic agents that identify and distinguish between young and senescent cells. This enables treatment of aging diseases induced or exacerbated by cellular senescence
New human GC6 gene, useful for identifying agents for treating diseases and/or conditions associated with cell senescence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                        activity in a sample. The method comprises treating the sample with a sample of bind telomerase, separating the solid phase from the sample to form a test sample which may be treated to elute bound telomerase and assaying the sample for telomerase activity. Also described are: (1) a kit (II) for detecting telomerase activity, comprising a solid phase and one or more components for assaying telomerase activity, and (2) a component (III) of an assay system for telomerase activity, comprising a solid phase for binding telomerase on which is present a substrate for telomerase elongation. (I) is useful for cancer diagnosis or prognosis and detection of micrometastasis as detection of telomerase activity is indicative of sancer or micrometastasis. The solid phase used in (I) is useful for separating telomerase from a sample and therefore for detecting telomerase from a sample and therefore for detecting and may
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PCR primer for

The present invention describes a method (I) for detecting telomerase activity in a sample. The method comprises treating the sample with a solid phase to bind telomerase, separating the solid phase from the sample to form a test sample which may be treated to elute bound to sample to form a saying the sample for telomerase activity. Also described are: (1) a kit (II) for detecting telomerase activity, in the components for assaying telomerase activity, components for assaying comprising a solid phase and one or more components for assaying telomerase activity, component (III) of an assay system for telomerase activity, comprising a solid phase for binding telomerase activity, comprising a solid phase for binding components on which is present a substrate for telomerase elongation. (I) is useful for cancer or micrometastasis. The solid phase used in (I) is useful for cancer or micrometastasis. The solid phase used in (I) is useful for separating telomerase from a sample and therefore for detecting cancer cells and also comprises means for assaying an mRNA diagnostic for cancer. The present sequence represents a reverse transcriptase (RT) FCR primer for intermity telomerase RNA, which is used in an example from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Detecting telomerase activity in samples, useful for diagnosis of cancer and micrometastasis, comprises treating sample with solid phase, removing solid phase and treating to elute bound telomerase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; telomerase; hTR; reverse transcriptase; RT-PCR; PCR primer; detection; cancer; micrometastasis; diagnosis; ss.

The invention relates to detecting human telomerase RNA template (HTR) RNA can a bodily fluid, comprising amplitying RNA extracted from plasma or in a bodily fluid, comprising amplitying RNA extracted from plasma or serum sample, or its corresponding CDNA comprising(1), using primers or probes that target (1) or CDNA and detecting qualitatively or consequence of (1) or cDNA product. The method is useful for detecting (1) in a bodily fluid, which is useful for consequence of (1) or cDNA product. The method is useful for detecting (1) in a bodily fluid, which is useful for consequence of (1) or cDNA product. The method is useful for detecting (1) in a bodily fluid, which is useful for consequence of (1) or cDNA product. The method is useful for detecting of (1) expressing cells or tissue which include a malignancy preferably a cancer of breast, ovarian, head and neck, lung, cervical, colorectal, gastric, liver, pancreatic, bladder, prostate, consequence of cervical intracapithalial neophasia, bronchial dysplasia, atypical carricraphical in repeats of arcombar and an estur carcinoma in situ, colorectal adenoma, atypical endometrial hyperplasia, or Barrett's ossophagus, where the carpina of the breast, ductal carcinoma in situ. The method is a consequence of therapy, which comprises selecting the human for the therapy after the also useful for treating a human with cancer for telomerase-directed therapy, which comprises selecting the human for the therapy after detection of (1), for determining a need for diagnostic test in a human. Consequence of (1), for determining a need for diagnostic test in a human (1) provides a marker which is utilised as a diministered to a human. (1) provides a marker which is utilised as a prognosis in these patients. The method also allows is dentification or analysis, either quantitatively or qualitatively, of (1) in plasma or premalignant or malignant cancer for longered therapy as an early consequence of for further therapy or who has completed therapy or treatment failure.
                                                                                                                                                                                                                            cancer; breast; ovarian; head and neck; lung; cervical; colorectal; gastric; liver; pancreatic; bladder; prostate; brain; kidney; oesophagus; melanoma; sarcoma; premalignancy; carcinoma in-situ; cervical dysplasia; bronchial dysplasia; cervical intraepithelial neoplasia;

The method is useful for detecting (i) in a bodily fluid, which is useful for detecting (i) in a bodily fluid, which is useful for malignancy preferably a cancer of breast, ovarian, head and neck, lung, cervical, colorectal, gastric, liver, pancreatic, bladder, prostate, endometrial, brain, kidney, or oesophagus, or a melanoma or sarcoma, premalignancy or carcinoma in-situ, preferably cervical dyplasia, ervical dyplasia, atypical hyperplasia of the breast, ductal carcinoma in-situ, colorectal adenoma,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cancer; breast; ovarian; haad and neck; lung; cervical; colorectal; gastric; liver; pancreatic; bladder; prostate; brain; kidney; oesophagus; melanoma; sarcoma; premalignancy; carcinoma in-situ; cervical dysplasia; bronchial dysplasia; cervical intraepithelial neoplasia; atypical hyperplasia; colorectal adenoma; atypical endometrial hyperplasia; tumour; Barrett's oesophagus;
method allows the development and application of telomerase-specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; telomerase-associated RNA template; hTR; endometrial; malignancy;
                     therapy even when only premalignant tumours, early cancer, or occult cancer or metaetcasis auch as following resection or in minimal residual disease are present. The present sequence represents a PCR primer for human telomerase-associated RNA template (hTR)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  reverse

the atypical endometrial hyperplasia, or Barrett's oesophagus, where the human is at risk for developing a malignancy or premalignancy or is known to have malignancy, premalignancy or carcinoma in situ. The method is also useful for treating a human with cancer for telomerase-directed therapy, which comprises selecting the human for the therapy after ceferction of [1], for determining a need for dagnostic test in a human with malignancy or premalignancy amonitoring a therapy of the manignancy or premalignancy and for monitoring a therapy of with malignancy or premalignancy and for monitoring a therapy of computer therapeutic effect has been achieved, or whether additional or more advanced therapy is required, and to assess prognosis in these patients. The method also allows identification or whether additional or more advanced therapy is required, and to assess prognosis, either quantitatively or qualitatively, of [1] in plasma or canalysis, either quantitatively or qualitatively, of [1] in plasma or canalysis, either quantitatively or qualitatively, of [1] in plasma or canalysis, either quantitatively or qualitatively, of [1] in plasma or canalysis, either quantitatively or qualitatively, of [1] in plasma or canalysis, either quantitatively or premalignant lesions, and thus allow stratification of such core their risk of residual cancer following surgery, and their consect for further therapy or who has completed therapy as an early or hear who has completed therapy as an early or them man and the planes of the planes of development and application of telomerase specific themselved to the planes of the planes of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                           therapy even when only premalignant tumours, early cancer, or occult cancer or metastasis such as following resection or in minimal residual disease are present. The present sequence represents a PCR primer for human telomerase-associated RNA template (hTR)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Peptide products of the human TPC2 and TPC3 gene are involved in regulation of telomere length and activity are useful to diagnose and treat telomere length and activity-related diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to methods and reagents for regulating telomere length and for modulating telomerase activity in mammalian cells. The method is variety of related diagnostic and therapeutic purposes. The method is useful for screening, diagnosing, monitoring and treating diseases and other conditions such as cancer, pregnancy, fertility, telomere length and telomerase-activity. The present sequence is a reverse transcription (RT) PCR primer used for amplifying human telomerase (hTR) cDNA
invention also relates to purified, synthetic or recombinant peptides such as TPC2 or TPC3 used for detecting regulators of telomere length and telomerase activity in mammalian cells and for a variety of related diagnostic and therapeutic purposes. The method is useful for screening, diagnosing, monitoring and treating diseases and other conditions such as ancer, pregnancy, fertility, telomere length and telomerase-activity. The present sequence is a reverse transcription (RT) PCR primer used for amplifying human telomerase (hTR) cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to methods and reagents for regulating telomere length and for modulating telomerase activity in mammalian cells. The invention also relates to purified, synthetic or recombinant peptides such as TPC2 or TPC3 used for detecting regulators of telomera length and telomerase activity in mammalian cells and for a variety of related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Peptide products of the human TPC2 and TPC3 gene are involved in regulation of telomere length and activity are useful to diagnose and treat telomere length and activity-related diseases.
                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; telomerase; TR; telomerase activity-related disease; therapy; cancer; pregnancy; fertility; RT-PCR primer; ss.

Accurate, reliable diagnosis and/or prognosis of cancer, e.g. breast cancer, by analyzing the RNA components of telomerase in plasma or serum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      monitoring the evolution of cancers. The method comprises analysing enzyme telomerase RNA in blood plasma or serum. The method is typically used for diagnosing breast, ovarian, stomach or colon cancer and/or monitoring the evolution of the cancers after treatment by chemotherapy or operations. The present sequence is a PCR primer for human telomerape RNA (HTR), which was used in the example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; ss; PCR; telomerase; cancer; pregnancy; fertility; neoplasm; hTR; RT-PCR; reverse transcriptase PCR; primer.

The invention relates to a monoclonal or isolated polyclonal antibody specifically binds human TPC2 or TPC3 (not defined, appearing as ADG82569 and ADG82571). Also included are an antibody obtained by collecting attribution a subject immunised with a peptide comprising at least 10 cantiguous amino acids of TPC-2 pr TPC-3, a host cell secreting the cartibody, a composition for obtaining a TPC2-specific antibody comprising at least 10 contiguous amino acids ADG82569, a composition for obtaining at least 10 contiguous amino acids ADG82569, a composition for obtaining a TPC3-specific antibody comprising at least 10 contiguous amino acids of ADG82571, an isolated, recombinant or synthetic nucleic acid encoding a peptide immunogenic for TPC2-specific antibody or TPC3-antibody and a host cell containing the nucleic acid. The antibody is useful for determining a condition in a subject associated with a high level of TPC2 or TPC3, and is useful for screening, diagnosing and monitoring conditions auch as secilated with inappropriate expression of TPC2 or TPC3 such as neoplasia. The present sequence is a reverse transcriptase (RT)-PCR primer used to analyse the expression profile of the human telomerase gene, which is co-expressed with TPC-2 and TPC-3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel monoclonal or isolated polyclonal antibody that specifically binds human TPC2 or TPC3. useful for treating neoplasia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Telomerase RNA; TR; promoter; cytotoxin; cancer; neoplasia; hTR; gene therapy; thymidine kinase gene; anticancer therapy; human;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human telomerase RNA gene (hTR) specific primer TRC3R.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 26 BP; 8 A; 6 C; 7 G; 5 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a monoclonal or isolated polyclonal antibody specifically binds human TPC2 or TPC3 (not defined, appearing as ADG8256) and ADG82571). Also included are an antibody obtained by collecting a natiserum from a subject immunised with a peptide comprising at least 10 contiguous amino acids of TPC-2 pr TPC-3, a host cell secreting the ar least 10 contiguous amino acids of TPC-2 pr TPC-3, a host cell secreting the a least 10 contiguous amino acids of ADG82569, a composition for obtaining a TPC3-specific antibody comprising a TPC3-specific antibody comprising a TPC3-specific antibody contiguous amino acids of ADG82571, an isolated, recombinant or synthetic nucleic acid encoding a peptide immunogenic for TPC2 sepecific antibody or TPC3-antibody and a host cell containing the nucleic acid. The antibody is useful for ceremining a condition in a subject associated with a high level of TPC2 or TPC3, and is useful for screening, diagnosing and monitoring conditions such as cancer, pregnancy or fertility. The antibody is also useful for treating conditions associated with inappropriate expression of TPC2 or TPC3 such as neoplasia. The present sequence is a reverse transcriptes (RT)-PCR primer used to analyse the expression profile of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; 88; PCR; telomerase; cancer; pregnancy; fertility; neoplasm; hTR; RT-PCR; reverse transcriptase PCR; primer.

 ઠે
                                                                                                                                                                                                                                          RNA (TR) component genes. The TR gene promoter can be linked to a heterologous gene, especially a gene encoding a cytotoxin, for therapy of cancer, especially neoplasias. The telomerase is necessary for the cancer, especially neoplasias. The telomerase is necessary for the curestricted proliferative capacity of many human cancers. Mutation or upregulation of the telomerase repression pathway may cause reactivation or upregulation of telomerase expression in cancer. Substances, clamping the methods, can be used to block transcription from the TR gene promoter through interaction of the 5' regulatory sequences. These cubstances, e.g. antitaense oligonuclectides, transcription factors, peptide nucleic acids and factors that disrupt signal transduction, are useful for cancer therapy. In particular, gene therapy vectors cancer therapy. In particular, gene therapy vectors cancer therapy. In particular, gene therapy vectors can be used to convert a producy, e.g. gancyclovir, so that neoplasia can be controlled or treated. Direct down-regulation of telomerase RNA gene through manipulation of transcription factors may be effective anticancer therapy and the cloning of the hTR gene promoter activity. Sequences AAZ07623-80 represents PCR primers for amplifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .;

The present sequence represents a human telomerase RNA sequence which is the target of peptide nucleic acid molecules (PNA). The PNA molecules the target of peptide nucleic acid molecules (PNA). The PNA molecules contained within the RNA component of mammalian telomerase, and inhibit telomerase activity. Telomerase is a ribonucleoprotein enzyme that telomerase activity. Telomerase is a ribonucleoprotein enzyme that telomerase activity. Telomerase is a ribonucleoprotein enzyme that contained within the RNA component of the enzyme. The nucleoride sequence contained within the RNA component of the enzyme. The nucleoride sequence contained within the RNA component of the enzyme. The nucleoride sequence contained within the RNA component of the PNA bases which include the sequence GTTAGG. The uncharged nature of the PNA bases the melting temperature of associating strands, increases the rate of association by the targeted nucleic acids, and afformed grader resistance of degradation by proceases or nucleases. The terapeutic PNAs may be used for treating disease conditions such as cancers, neoplasia, hyperplasia, therefore metabolism or telomerase diseases characterized by abnormal telomera metabolism or telomerase characterized by abnormal telomera metabolism or telomerase deformedeformel and other nucleotides. PNAs may be used for molecular diagnostics, labelled PNAs are used as hybridization probes to detect or quantitate polymucleotides having a human telomerase RNA (hTR) sequence. PNA probes are also used for forensic identification of individuals, e.g. paternity testing, based on hTR gene restriction of individuals, e.g. paternity testing, based on hTR gene restriction almost and elect the RNA component of a mammalian telomerase and as inhibitors of telomerase activity. The method of the present invention can be used to detect an immortal or meoplastic cell or tumour issue or cancer of any origin, provided the meaning activity and its RNA component cells any detect an immortal or meoplastic cell expresses telome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Mammalian; forensic; paternity testing; human telomerase RNA component; hTR gene RFLP pattern; cancer; inflammation; lymphoproliferative disease; autoimmune disease; neurodegenerative disease; neoplasia; hyperplasia; HIV; AlDS; human immunodeficiency virus; telomere metabolism; cytostatic; acquired immunodeficiency syndrome; anti-inflammatory; ss.
                                                                     New peptide nucleic acid (PNA) compounds that inhibit telomerase activity in mammalian cells is useful as probes to detect the RNA component of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to peptide nucleic acids (PNAs), comprising a sequence of 6-25 nucleobases, that inhibit telomerase activity in mammalian cells by hybridising to the RNA component of mammalian telomerase. The PNAs are useful as probes to detect the RNA component of mammalian telomerase and as inhibitors of telomerase activity, or to detect and/or quantitate polymucleotide having the human telomerase RNA component (hTR) sequence, as well as in forensic identification of individuals, such as paternity testing or identification of criminal suspects or unknown descendants based on the HTR gene RRLP pattern. The PNA can be further used for treating or preventing cancer, inflammation, lymphoproliferative diseases, autoimmune disease, or neurodegenerative diseases. The PNAs in combination with other pharmaceuticals (such as antineoplasis, human immunodeficiency virus (HIV) infections, acquired immunodeficiency syndrome (AIDS) and associated pathologies, and other diseases characterised by abnormal telomerase detabolism or telomerase activity. The present sequence representing hTR RNA strand #1 is used to the the inhibition of telomerase activity by the PNAs of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

This can be used in the treatment of aberrant cell growth, including cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New polynucleotide(s) anti:sense to human telomerase - used for detecting or inhibiting human telomerase, e.g. for treating cancers, contraception,
                                                                                                                                                                                                                                  Inhibiting or reducing growth of cell for treating cancer, comprising administering telomere damage-inducing agent and telomerase inhibitory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             RNA component; human telomerase; antisense oligonucleotide; infection; neuroblastoma; bladder cancer; colon cancer; prostate cancer; cancer; contraception; sterilisation; immunosuppression; therapeutic; hTR; immune system down-regulation; anti-inflammatory therapy; ss.

antisense oligonucleotides to the RNA component of human telomerase (hTR). These antisense oligonucleotides specifically hybridise to a nucleotide component of the hTR, but that does not hybridise to a sequence within the remplate region of hTR. These oligonucleotides may specifically be used for detection of an RNA component of human telomerase in a sample. This is useful for diagnosing cancer (especially neuroblastoma, bladder, colon and prostate cancer), and providing prognosis for a cancer patient. The inhibitory coligonucleotides can inhibit the telomerase activity level in a cell by interfering with transcription of the RNA component, decreasing the half-coller of the telomerase RNA component transcript, inhibiting assembly of the RNA component transcript, inhibiting the coller of the RNA component into the telomerase Answer of inhibiting the coller in vivo. They can be used in therapeutics for treating or cells in vivo. They can be used in therapeutics for treating or preventing cancer, for contraception or sterilisation, for immunosuppression, and for selectively down-regulating specific branches confine immune system, e.g. a specific subset of rcells, in anti-cinflammatory therapies or for treating infections by, e.g. yeast,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This is an oligonucleotide used in the measurement of Tm values and their complimentary peptide nucleic acids (PNAs), (e.g. AAT89228-T89233, AAT89243-T89244). PNAs hybridise specifically to an RNA component of mammalian telomerase, and include the sequence GGG for specific hybridisation to the template region of this component. PNAs can be used as probes to detect the RNA component of mammalian telomerase and as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            nsed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Peptide nucleic acid, PNA; cancer, telomerase, probe, hybridisation, inhibitor; human telomerase RNA; hTR; PCR; oligonucleotide; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents PCR primer TRC31 used for amplifying the human telomerase (hTR) template. The RNA and DNA can be used in hybridisation assays to detect or quantify telomerase activity in cells, tissue or fluid samples, e.g. for diagnosis of eukaryotic parasites (yeast and protozoa) or tumours. It is also useful as primers for amplification assays. The truncated or recombinant vertebrate telomerase is used therapeutrically to increase telomerase activity (also as reagents in the screening assay) while the RNA or other inhibitors such as antisense molecules, are used to reduce such activity. Typical applications are initiation/restoration of activity to cause senescence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        telomerase. Detecting telomerase allows early diagnosis of tumour or infection, before clinical signs manifest. Telomerase inhibitors directed against e.g. Trypanosoma should cause fewer side effects than drugs currently used to treat such infections. The DNA encodes those parts of MTR RNA essential for activity but are significantly shorter than the
                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cancer; eukaryotic parasite; hTR; vertebrate telomerase; yeast; protozoa;
inhibitors of telomerase activity, especially in the treatment of cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DNA encoding essential RNA components of human telomerase - also truncated or recombinant telomerase, useful for diagnosis and treatment of cancer and infection by eukaryotic parasites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  or to prevent immortalisation of cells in tumours or parasites. The DNA is also used to produce recombinant telomerase, which can then be used conventionally to raise antibodies for diagnostic detection of

primers AAV68464-65 are used for the RT-PCR amplification of the RNA component of human telomerase (hTR). The invention relates to an activator-antisense complex (A1) that comprises: (a) an antisense oligonucleotide, complementary to a 12-25 nucleotide portion of hTR, with a hydroxyl moiety at the first end; and (b) a linker attached to the first. The activator-antisense complex may be used for inhibiting the growth of a celomerase-expressing malignant cell or tumour. The complex is used to specifically y cleave the ribonucleotide portion of a telomerase enzyme. The complex inhibite growth of telomerase expressing malignant glioma, breast tumour, renal cell cancer. The complex inhibite growth of telomerase expressing malignant glioma, breast tumour, renal cancer.

The complex inhibite growth of telomerase expressing malignant cells from brain tumour malignant glioma, breast tumour, renal call cancer.

C disorders, may be treated including various acute and chronic leukemias, polychemia vera, Hodgkin's and non-Hodgkin's lymphomas, multiple mylenen, Maldenstrom's macroglobulinemia, heavy chain disease, and solid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cleave; brain; tumour malignant glioma; breast tumour; renal cell câncer; melanoma; prostete cancer; leukemia; polytchemia vera; myeloma; sarcoma; Hodgkin's lymphoma; Waldenstrom's macroglobulinemia; heavy chain disease; carcinoma; chemotherapeutic; antisense; RT-PCR; primer; ss.

primers AAV68464-65 are used for the RT-PCR amplification of the RNA component of human telomerase (hTR). The invention relates to an activator-antisense complex that comprises: (a) an antisense of longular complementary to a 12-25 nucleotide portion of hTR, with a hydroxyl moiety at the first end; and (b) a linker attached to the first end; and (c) an activator of RNase L attached to the linker. The cutvator-antisense complex may be used for inhibiting the growth of a telomerase-expressing malignant cell or tumour. The complex is used to specifically cleave the ribonucleotide portion of a telomerase enzyme. The complex inhibits growth of telomerase expressing malignant cells from rain tumour malignant glioma, breast tumour, renal cell cancer. Menson therefore and chronic leukemias, collected and prostate cancer. Many other malignancies and related disorders, may be treated including various acute and chronic leukemias, polycthemia vera, Hodgkin's and non-Hodgkin's lay lymphomas, multiple myeloma, waldenstrom's macroglobulinemia, heavy chain disease, and solid tumours, including numerous sarcomas and carcinomas. The complex is
                                                                                                                                                                                                                                                             Human; telomerase; hTR; activator-antisense complex; malignant; enzyme; cleave; brain; tumour malignant glioma; breast tumour; renal cell cancer; melanoma; prostate cancer; leukemia; polycthemia vera; myeloma; sarcoma; Hodgkin's lymphoma; Waldenstrom's macroglobulinemia; heavy chain disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New RNase L activator-telomerase antisense complex - useful to inhibit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      particularly either cisplatin, doxorubicin, mitomycin, daunorubicin,
bleomycin, actinomycin D, or neocarzinostatin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     preferably administered in combination with a chemotherapeutic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention trained to promoter regions trong and inheritor trained to a cancer, especially a gene promoter can be linked to a cancer, especially neoplasias. The telemerase is necessary for the cancer, especially neoplasias. The telemerase is necessary for the unrestricted proliferative capacity of many human cancers. Mutation or dysregulation of the telemerase repression pathway may cause reactivation or dysregulation of the telemerase expression in cancer. Substances, identified in the methods, can be used to block transcription from the TR cance promoter through interaction of the 5' regulatory sequences. These substances, e.g. antisense oligomucleotides, transcription factors, captule nucleic acids and factors that disrupt signal transduction, are useful for cancer therapy. In particular, gene therapy vectors (especially pGT62-codAupp) comprising the promoter and a viral thymidine cuseful for cancer therapy in particular, gene therapy vectors can be used to convert a prodrug, e.g. gancyclovir, so that neoplasia can be controlled or treated. Direct down-regulation of telemerase RNA gene through manipulation of transcription factors may be effective anticancer therapy and the cloning of the HTM gene promoter allows the analysis of therapeutic molecules which modulate hTM promoter activity. Sequences AAZ07623-80 represents PCR primers for amplifying thuman TR gene (hTR) promoter sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to promoter regions from mouse and human telomerase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Mouse and human telomerase RNA gene promoters, useful for tumor specific
                                                                                                                                                                                                                                                                                                                Telomerase RNA; TR; promoter; cytotoxin; cancer; neoplasia; hTR; gene therapy; thymidine kinase gene; anticancer therapy; human;

RIA (TR) component genee. The TR gene promoter can be linked to a cancer, especially a gene encoding a cytotoxin, for therapy of cancer, especially neoplasias. The telomerase is necessary for the unrestricted proliferative capacity of many human cancers. Mutation or dysregulation of the telomerase repression pathway may cause reactivation or upregulation of telomerase expression in cancer. Substances, identified in the methods, can be used to block transcription from the TR gene promoter through interaction of the 5' regulatory sequences. These substances, e.g. antisense oligonucleotides, transcription factors, peptide nucleic acids and factors that disrupt signal transduction, are useful for cancer therapy. In particular, gene therapy vectors in particular, gene therapy vectors tinase gene can be used to convert a product and a viral thymidine compasia can be controlled or treated. Direct down-regulation of telomerase RNA gene through manipulation of transcription factors may be recommended.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ô
invention relates to promoter regions from mouse and human telomerase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          effective anticancer therapy and the cloning of the hTR gene promoter allows the analysis of therapeutic molecules which modulate hTR promoter activity. Sequences AAZ07623-80 represents PCR primers for amplifying human TR gene (HTR) promoter sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   5.3%; Score 24; DB 1; Length 24; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ଟ
                                                                                                                                                                                                                                                                                                                                                            The invention relates to promoter regions from mouse and human telomerase RNA (TR) component genes. The TR gene promoter can be linked to a neterologous gene, sepecially a gene encoding a cytocain, for therapy of cancer, especially neoplasias. The telomerase is necessary for the unrestricted proliferative capacity of many human cancers. Mutation or corresponding to telomerase repression pathway may cause reactivation of telomerase expression pathway may cause reactivation or dentified in the methods, can be used to block transcription from the TR gene promoter through interaction of the 5' regulatory sequences. These substances, e.g. antisense oligonucleotides, transcription factors, peptide nucleic acids and factors that disrupt signal transduction, are useful for cancer therapy. In particular, gene therapy vectors (sepecially pGTG2-codAupp) comprising the promoter and a viral thymidine kinase gene can be used to convert a producer and a viral thymidine coplasia can be controlled or treated. Direct down-regulation of telomerase RNA gene through manipulation of transcription factors may be telective anticancer therapy and the cloning of the hTR gene promoter allows the analysis of therapeutic molecules which modulate hTR promoter activity. Sequences AAZ07623-80 represents PCR primers for amplifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
